

bdd^{kickstart}

Higher quality on-time delivery with a single source of truth

BDD in a nutshell

Behaviour-Driven Development (BDD) is a set of practices that enables software teams to produce more valuable software with fewer bugs. BDD can lead to reduced development and maintenance costs and shorter time to market.

The two main practices of BDD are Specification by Example and Test-Driven Development.

Specification by Example

Specification by Example (SbE) is a technique that enables product owners, business analysts, testers and programmers to eliminate common misunderstandings about business requirements.

SbE uses examples in conversations to illustrate business rules and behaviour of the software to be built.

Test-Driven Development

Test-Driven Development (TDD) in the context of BDD turns examples into human-readable executable specifications.

Programmers use these specifications as a guide to implement increments of new functionality.

The result is a lean codebase and a suite of automated regression tests that keeps maintenance costs low throughout the lifetime of the software.

BDD Kickstart course

The BDD Kickstart course is a 2-day training that consists of two modules:

Day 1: BDD Fundamentals

Day 2: BDD with Cucumber

Coaching and mentoring

We offer on-site coaching and mentoring visits after the BDD Kickstart training to help your team overcome initial hurdles and teach you more advanced BDD techniques as you progress.

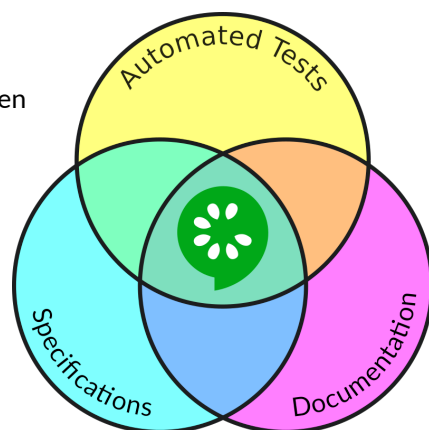

We have trained thousands people worldwide from organisations, including BBC, Sky TV, Amazon, Vanguard Group.

cucumber^{kickstart}

Cucumber is the world's most popular open source BDD tool, used by thousands of organisations and companies around the world.

Cucumber lets you keep specifications, automated tests and documentation in the same place - a single source of truth that's always in sync.

cucumber^{kickstart} Ltd

Cucumber Ltd is the company behind Cucumber. Our instructors have written books about BDD and Cucumber and are maintainers of the numerous Cucumber implementations for software platforms such as Java, Ruby and JavaScript.
